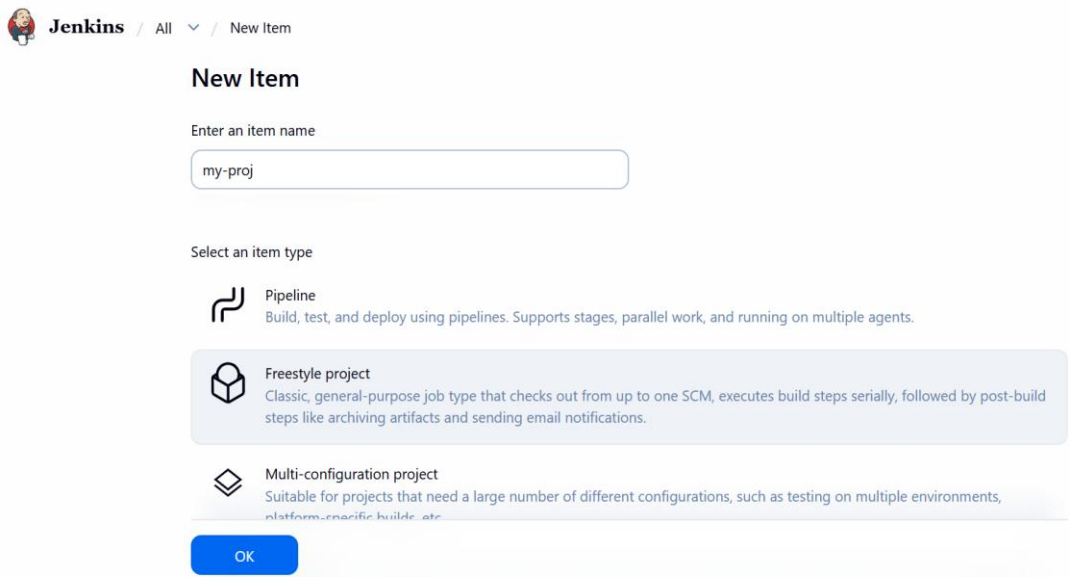
# Assignment 1

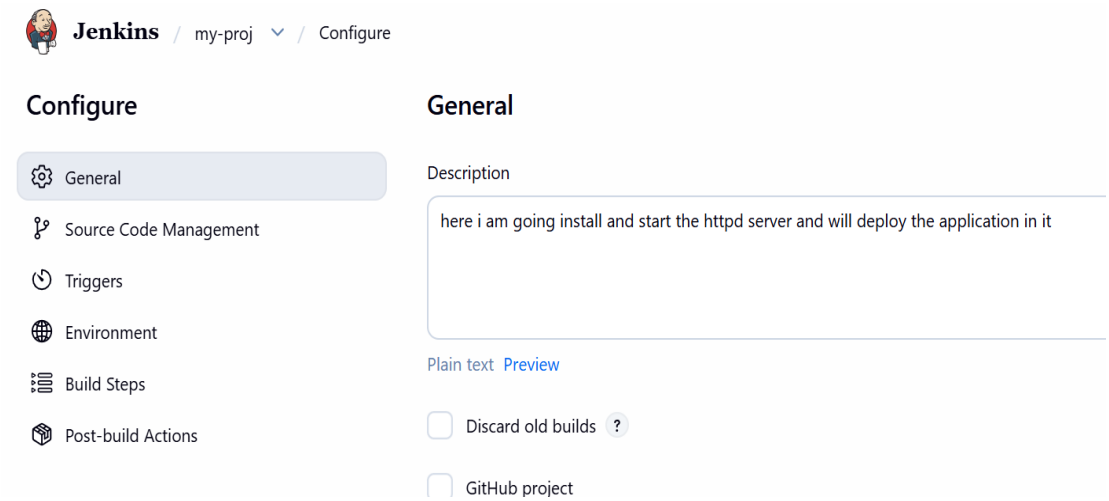
**Task:** Create a job on Jenkins to launch index.html on Apache httpd server.

**Steps:**

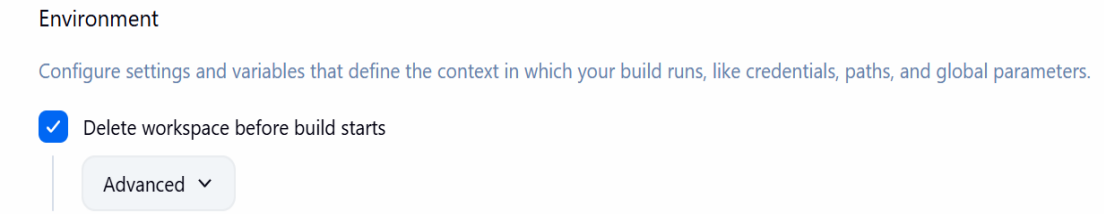
1. I launched an instance and installed java 17 and tomcat 10. In webapps folder of tomcat home directory I downloaded jenkins.war file and launched Jenkins after the sign in process.
2. Clicked on new item and created a freestyle project with the name of my-proj.



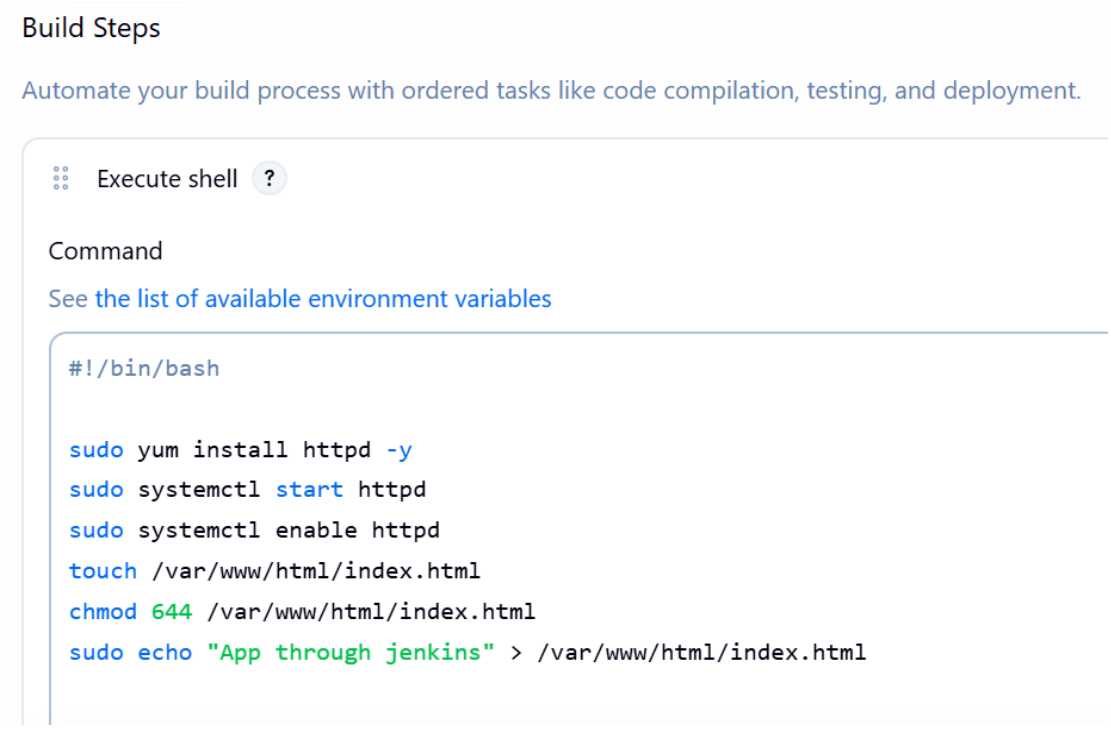
3. Given a job description.



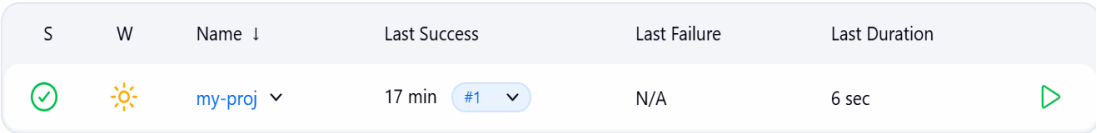
4. Selected “Delete workspace before build starts”. Though it is not necessary here because we are not creating any file in workspace folder.



5. Wrote a shell script in build step section.

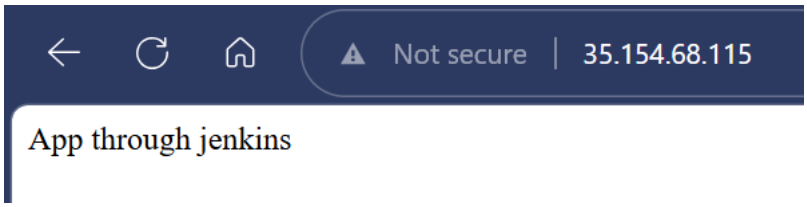


6. Then clicked on apply and save and the job got created.



7. After clicking on build now the job ran successfully.

8. Index.html hosted successfully on httpd server.



9. After running the job, the output from every command can be seen in console output.
   (Console output is given in separate document.)
