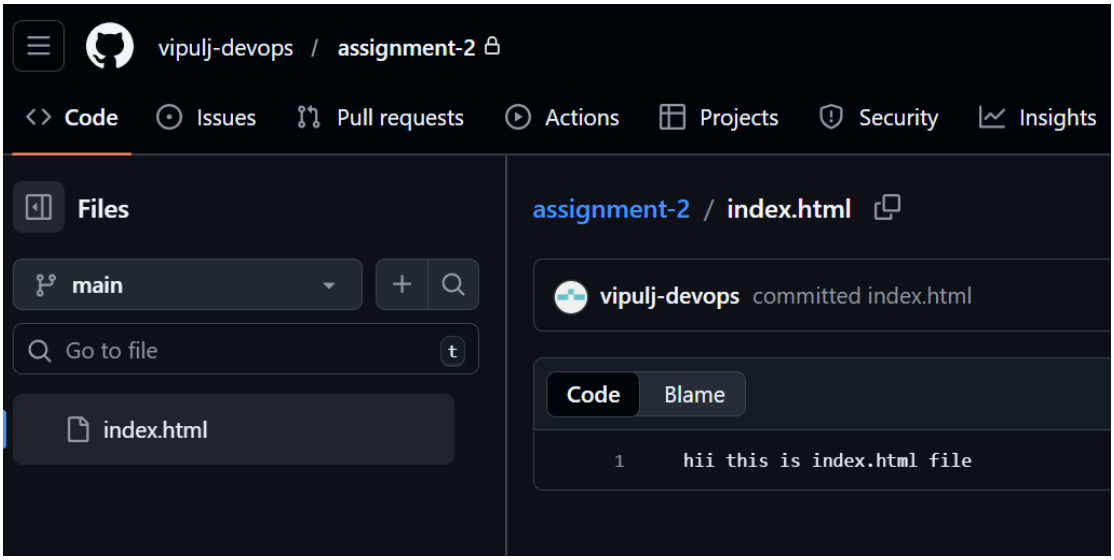
Assignment 2

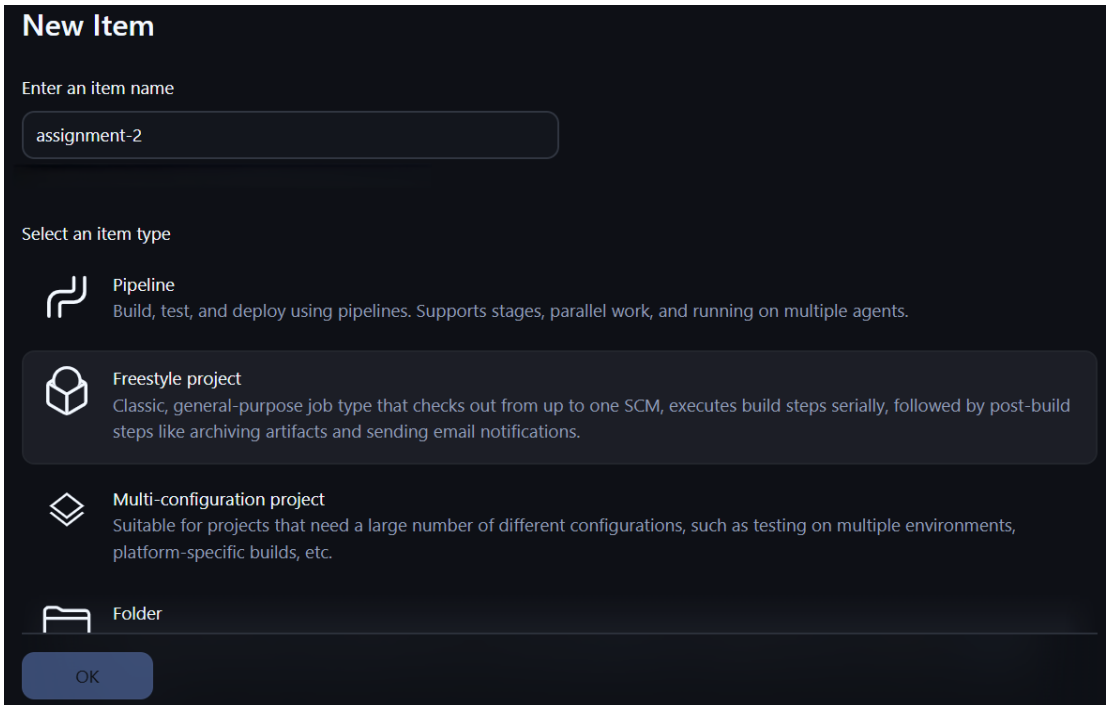
Task: Use Jenkins to host an index.html file from a private GitHub repo on an httpd server.

Steps:

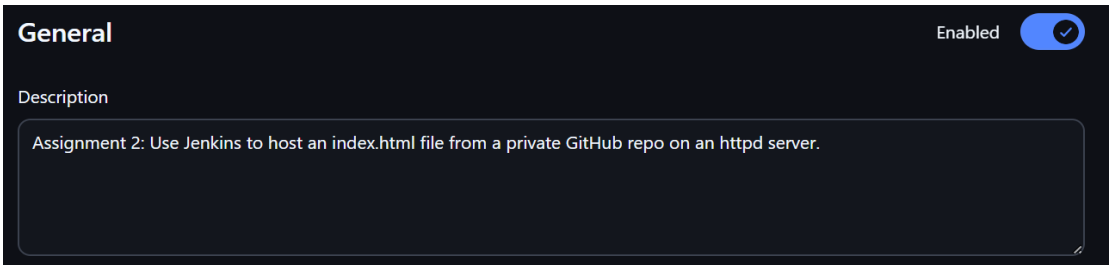
1. Created new private repo with the name “assignment-2” and created first commit with index.html file. The default branch is main.



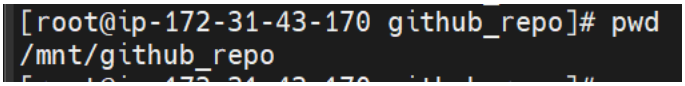
2. Now on Jenkins creating new freestyle project with the name “assignment-2”



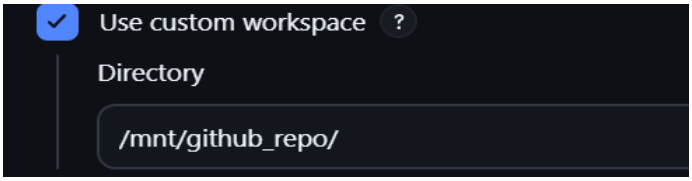
3. Added description.



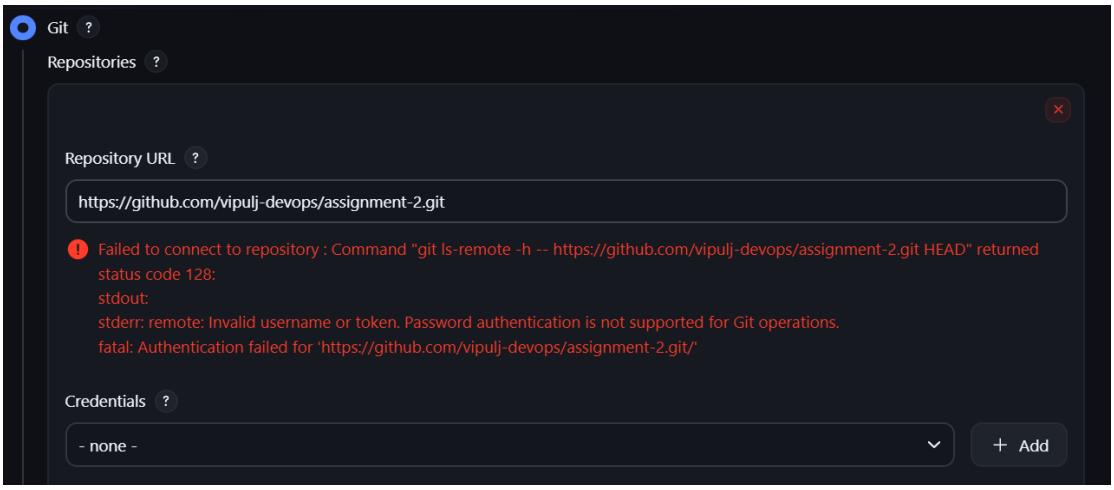
4. Created new folder with the name “github_repo” in /mnt directory.



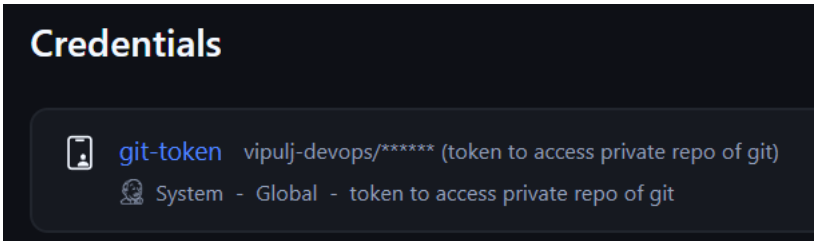
5. Added this location to custom workspace.



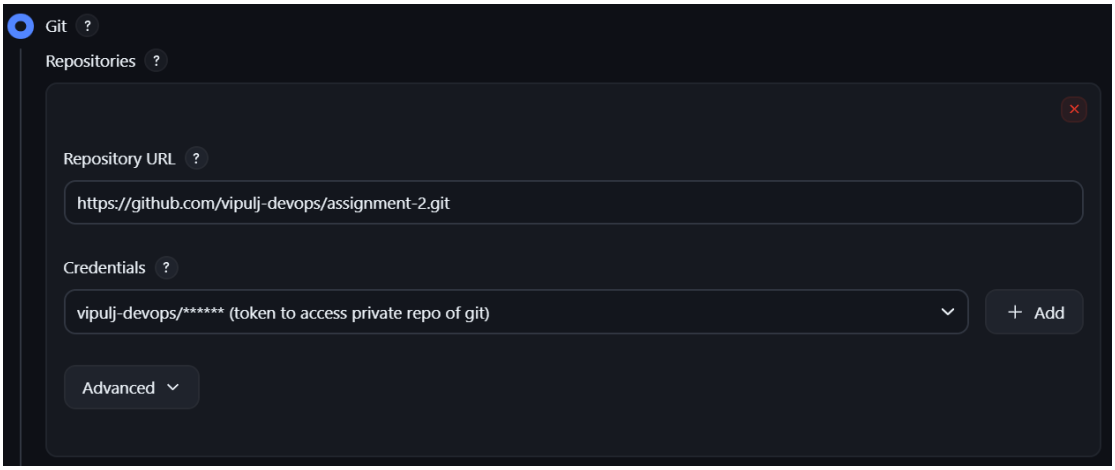
6. Added repository URL in git URL section while creating a job but the repo is private so it is failed to connect with the git repo.



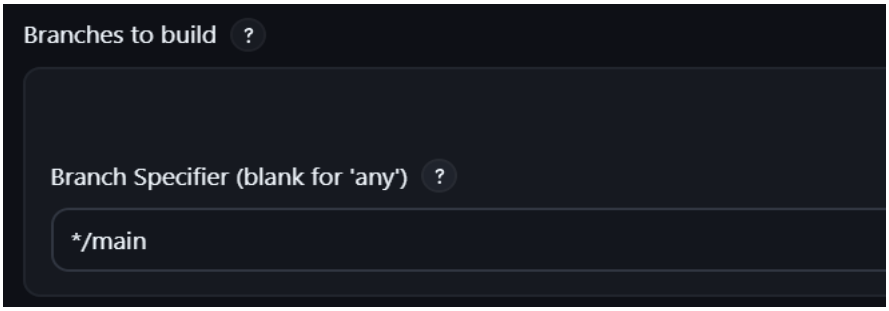
7. created a git token for git in the manage Jenkins/credentials section so that git private repo can be easily cloned in server using Jenkins



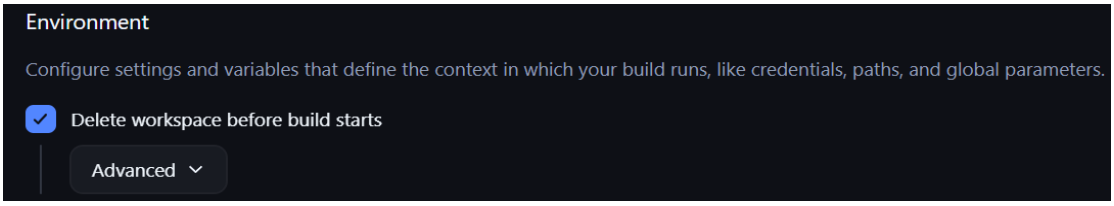
8. After setting token for that repository url, the error is gone.



9. Git hub main branch selected in branch to build section



10. Selected “Delete workspace before build starts” option so whenever the build will run more than once the workspace will be cleared.

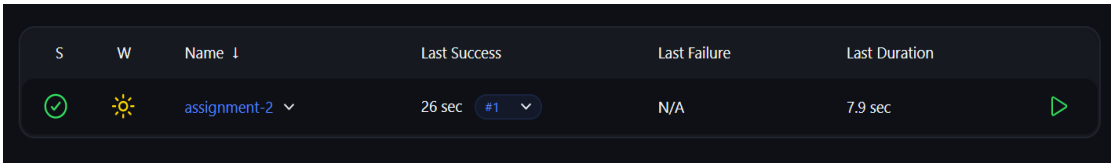


11. Selected execute shell option in build steps and wrote the script for deploying an index.html file from github on httpd server and then clicked on apply and then save.

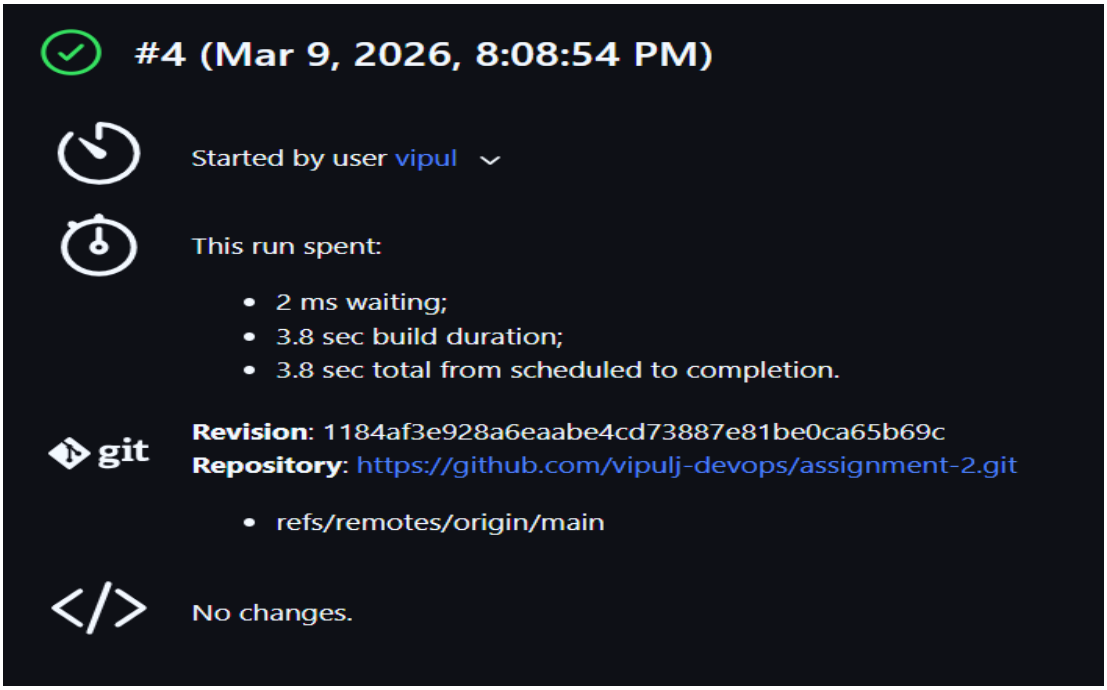
```
#!/bin/bash

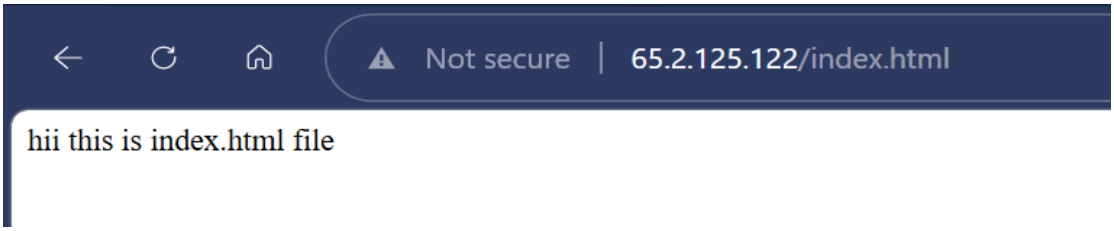
sudo yum install httpd -y
sudo systemctl start httpd
sudo systemctl enable httpd
sudo chmod -R 777 /var/www/html/
sudo cp /mnt/github_repo/index.html /var/www/html/
chkconfig httpd on
```

12. Now we can see that the build is created.



13. After clicking on build now option the job got executed and the build got created.





14. After this the index.html got deployed successfully on httpd server.
