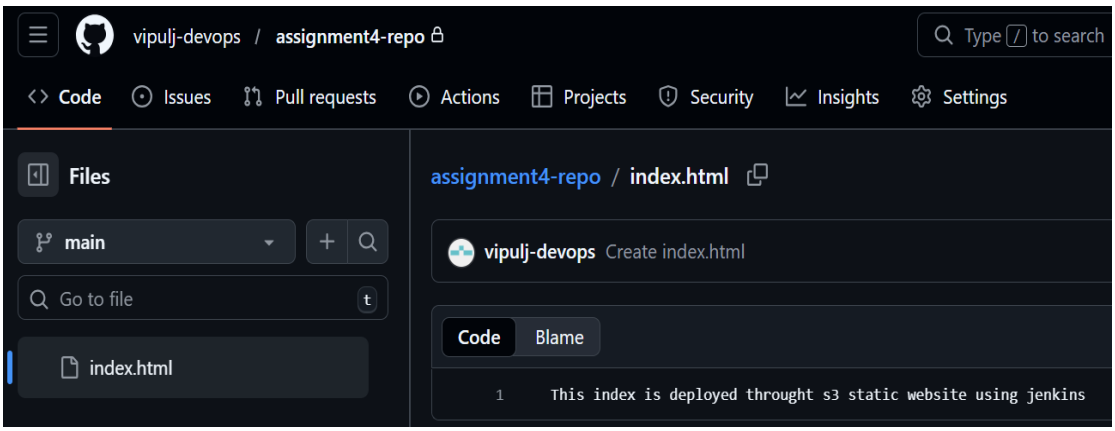
Assignment 4

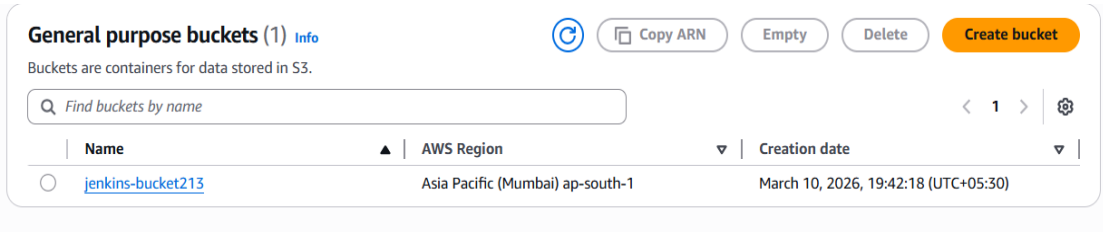
Task: Create a **private Git repository** containing an **index.html** file. Using **Jenkins**, fetch the file from the repository and deploy it to an **AWS S3 bucket configured for static website hosting** by executing **shell commands in the Execute Shell build step**.

Steps:

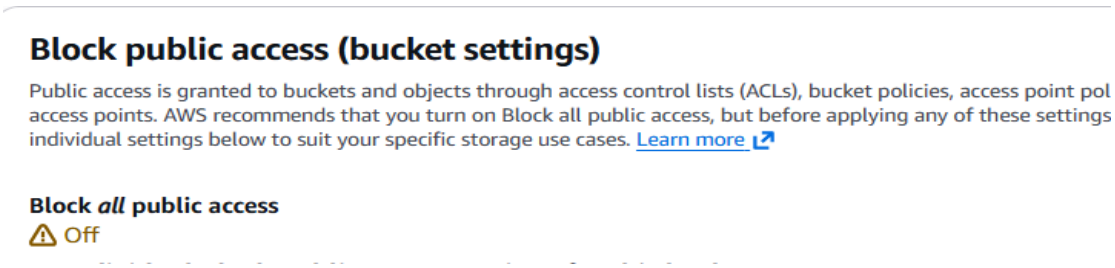
1. Created a private GitHub repository and committed index.html file in it.



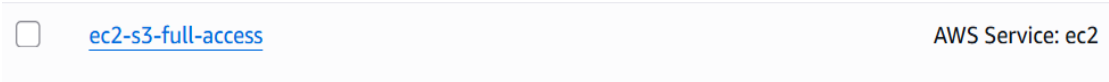
2. Created a s3 bucket.



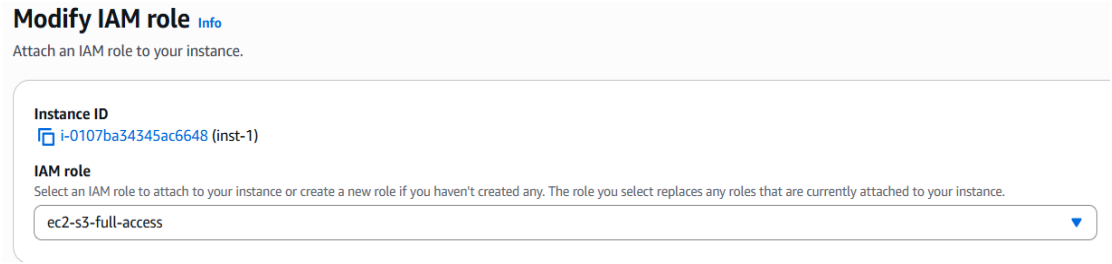
3. Made the bucket public



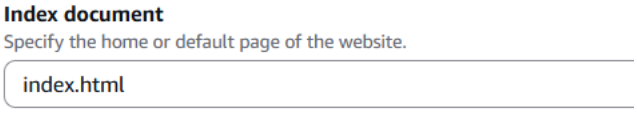
4. Create ec2 to s3 full access role



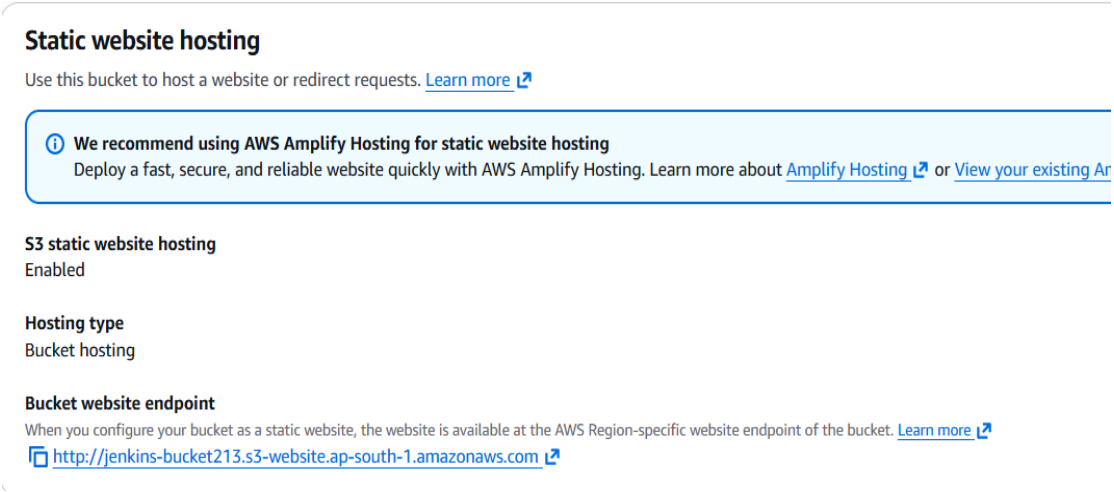
5. Attached the role to the instance (Jenkins master)



6. Selected index.html file while specifying index document while configuring static website hosting



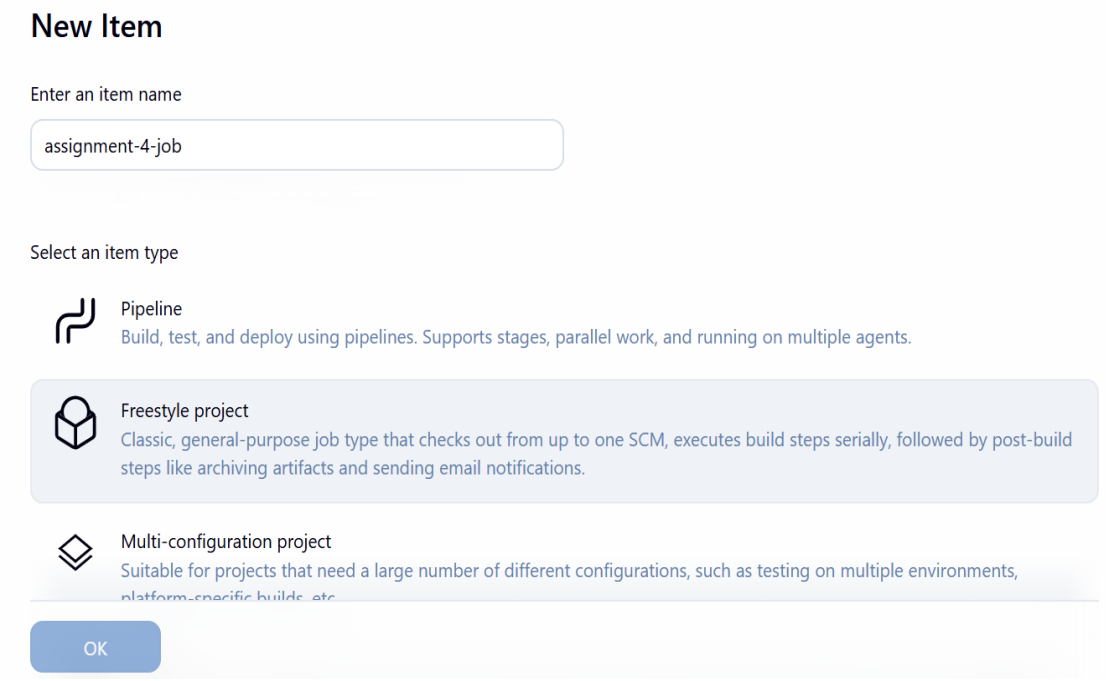
7. Enabled static website hosting and we can see the bucket website endpoint there.



8. Created git-repo folder in Jenkins master

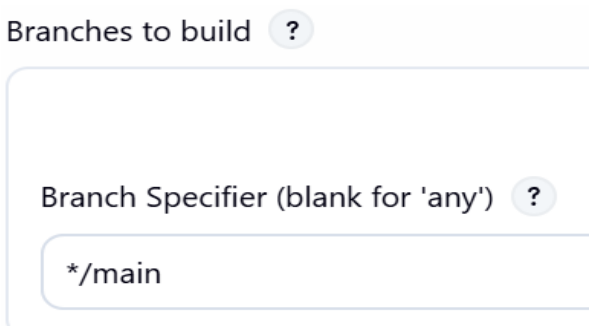
```
[root@ip-172-31-42-11 git-repo]# pwd
/mnt/git-repo
```

9. Creating the Jenkins job.

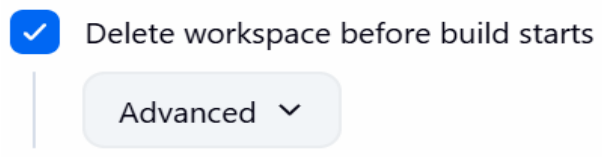


10. In source code management added GitHub repo URL and also attached git token to it.

11. Added main branch in branch to build in branch specifier section

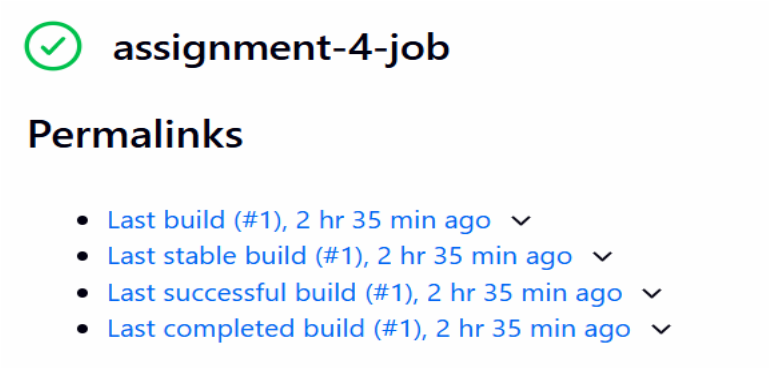


12. Checked delete workspace before build option

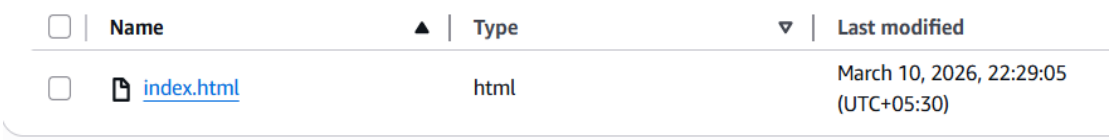


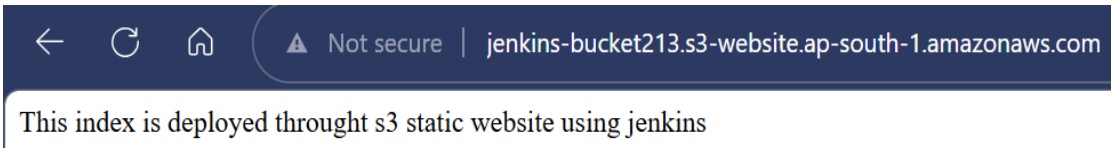
13. Wrote shell script in execute shell section in build steps and then clicked on apply and save

14. After clicking on build now the build got successful.



15. After running the build we can see the index.html file got added inside the bucket



Name	Type	Last modified
index.html	html	March 10, 2026, 22:29:05 (UTC+05:30)


16. Static website got hosted
